## Background

- Dataset provided by Toronto Public Health
- 15432 observations of confirmed or probable cases of COVID-19 in Toronto up to July 30, 2020
- Each observation consists of 18 values describing the case, such as age group, gender, source of infection, ICU admission, intubation, and outcome

## Observations

- Patient age highly correlates with outcome; older patients had more severe cases and higher rates of mortality
- Gender was not a significant factor in outcome or infection source
- Patient age also correlated to source of infection
- Young people would more likely contract COVID from close contact
- Outbreak associated infections were more common among older populations, likely from nursing home outbreaks
